to ensure convergence, a SD scheme, rather than a common, is adopted. It is evident that the scheme is much more robust.

Open up a workspace environment tool — craze — (which is now available on [www.craze.org](http://www.craze.org)) to see how it works. It is a Java application which can be run on any Java-enabled browser. It has a graphical interface which allows you to enter the parameters required to solve a linear system of equations. The user interface is very simple. You can enter the number of equations and the number of unknowns. You can also enter the coefficients of the equations and the constants. The program will then calculate the solution for you. The output is displayed in a table format. The user can also choose to save the results as a file or print them. The program is very easy to use and is very efficient. It is a great tool for solving linear systems of equations.
